

# Adaptation of a Commercial Greenhouse Gas Analyzer for Expanded Altitude Range

Kathryn McKain<sup>1\*</sup>, Colm Sweeney<sup>1</sup>, Tim Newberger<sup>1</sup>, Ed Wahl<sup>2</sup>

## Picarro Configuration

	Standard	Modified
<b>Cell pressure (torr)</b>	140	80
<b>Altitude ceiling (km)*</b>	8-10	13.5
<b>Precision (<math>1\sigma</math>)</b>	0.02 ppm CO <sub>2</sub> 0.2 ppb CH <sub>4</sub> 4 ppb CO	0.04 ppm CO <sub>2</sub> 0.5 ppb CH <sub>4</sub> 9 ppb CO
<b>Measurement interval (sec)</b>	2.4	1.2

\*With no upstream pumping or pressure control

Steps:

- Edit set-points in software
- Derive new “factory” calibrations
- Adjust pressure control parameters
- Reduce scans of CO peak

## Applications

### ORCAS

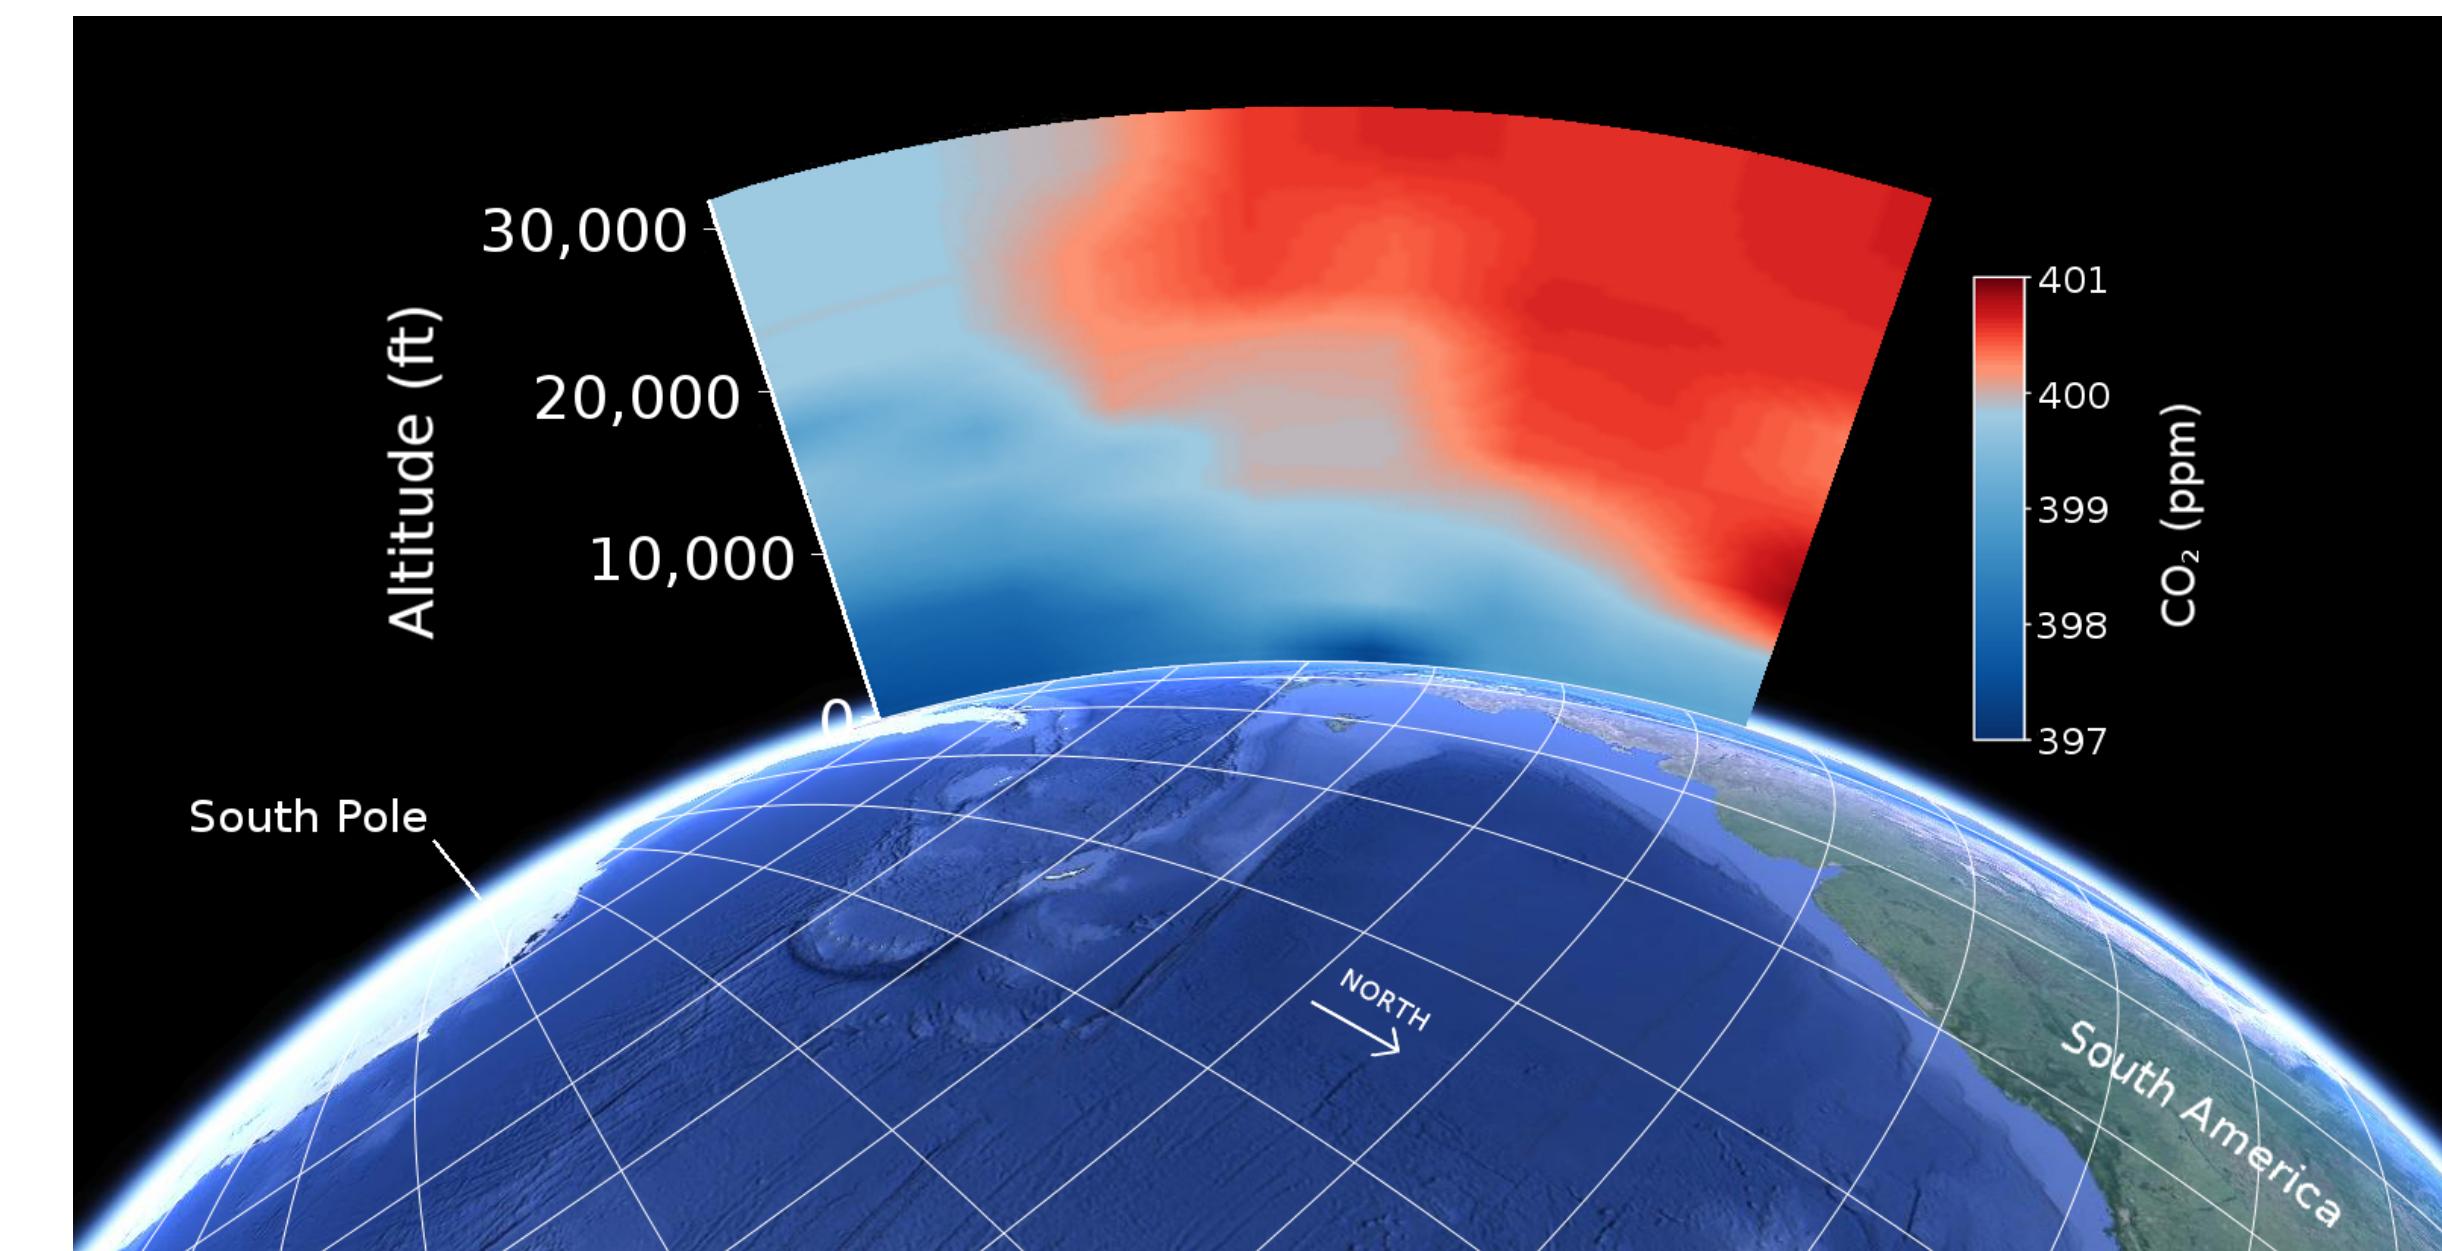

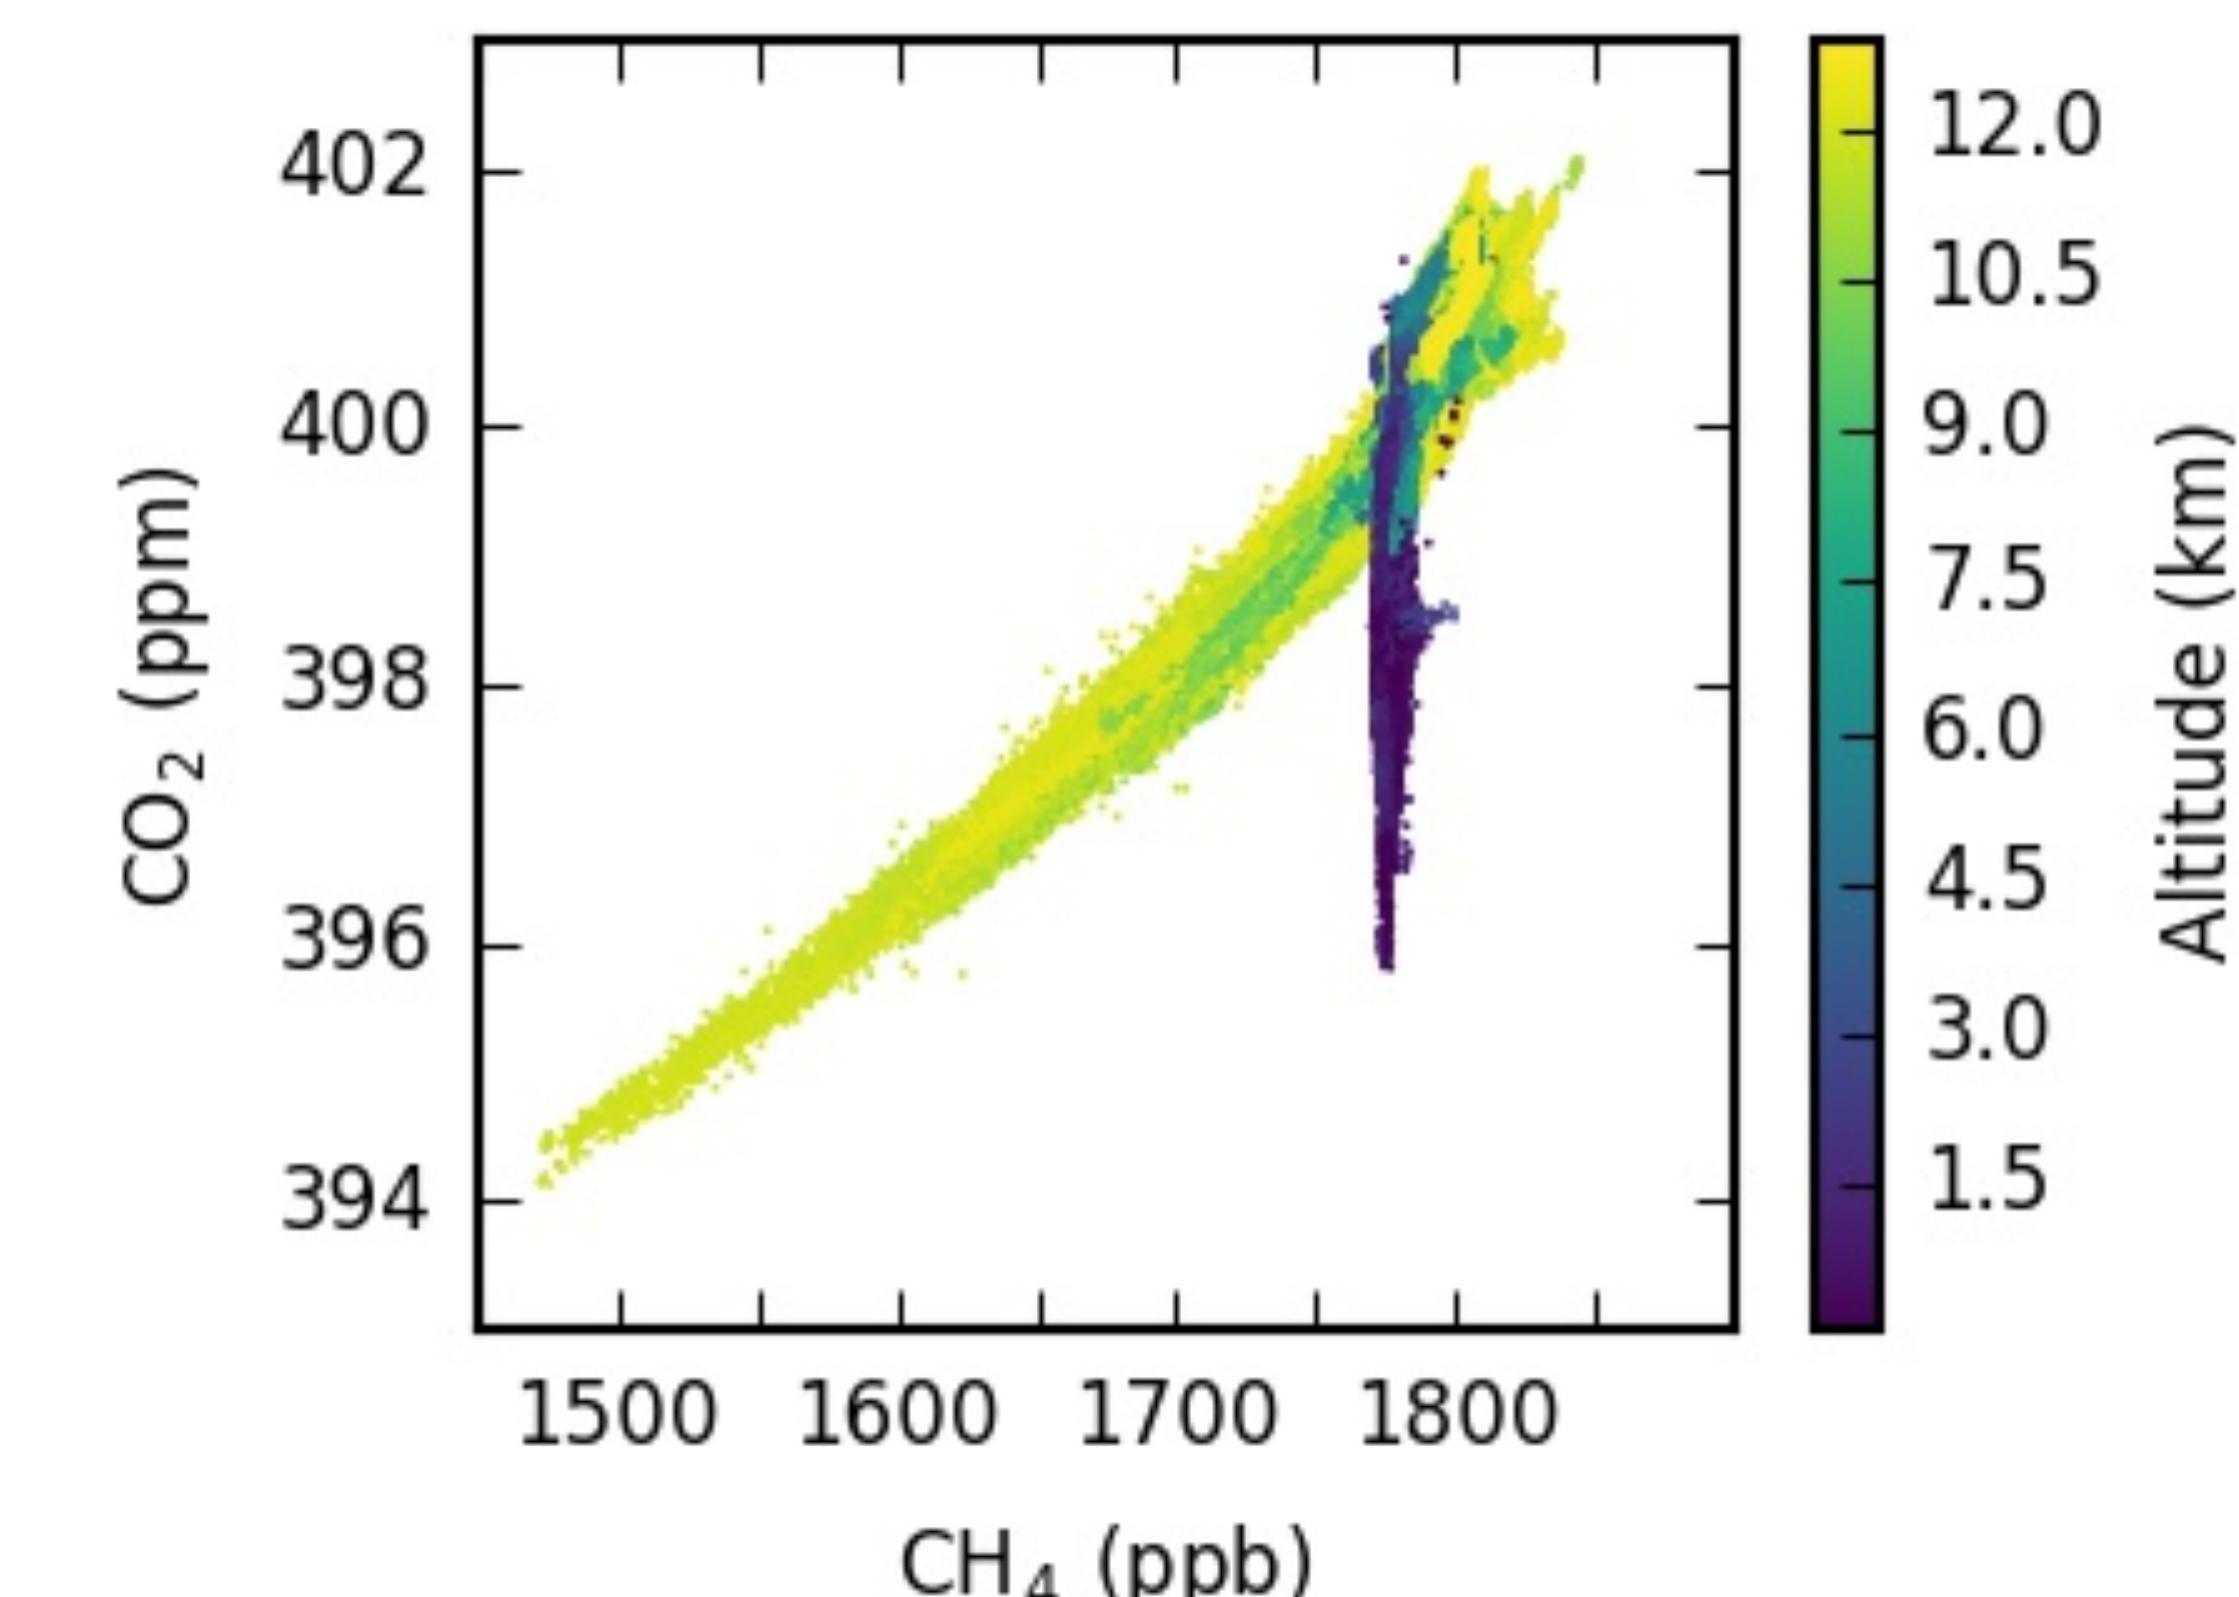

figure courtesy Eric Morgan, Scripps

### NCAR GV, Southern Ocean, Jan-Feb 2016

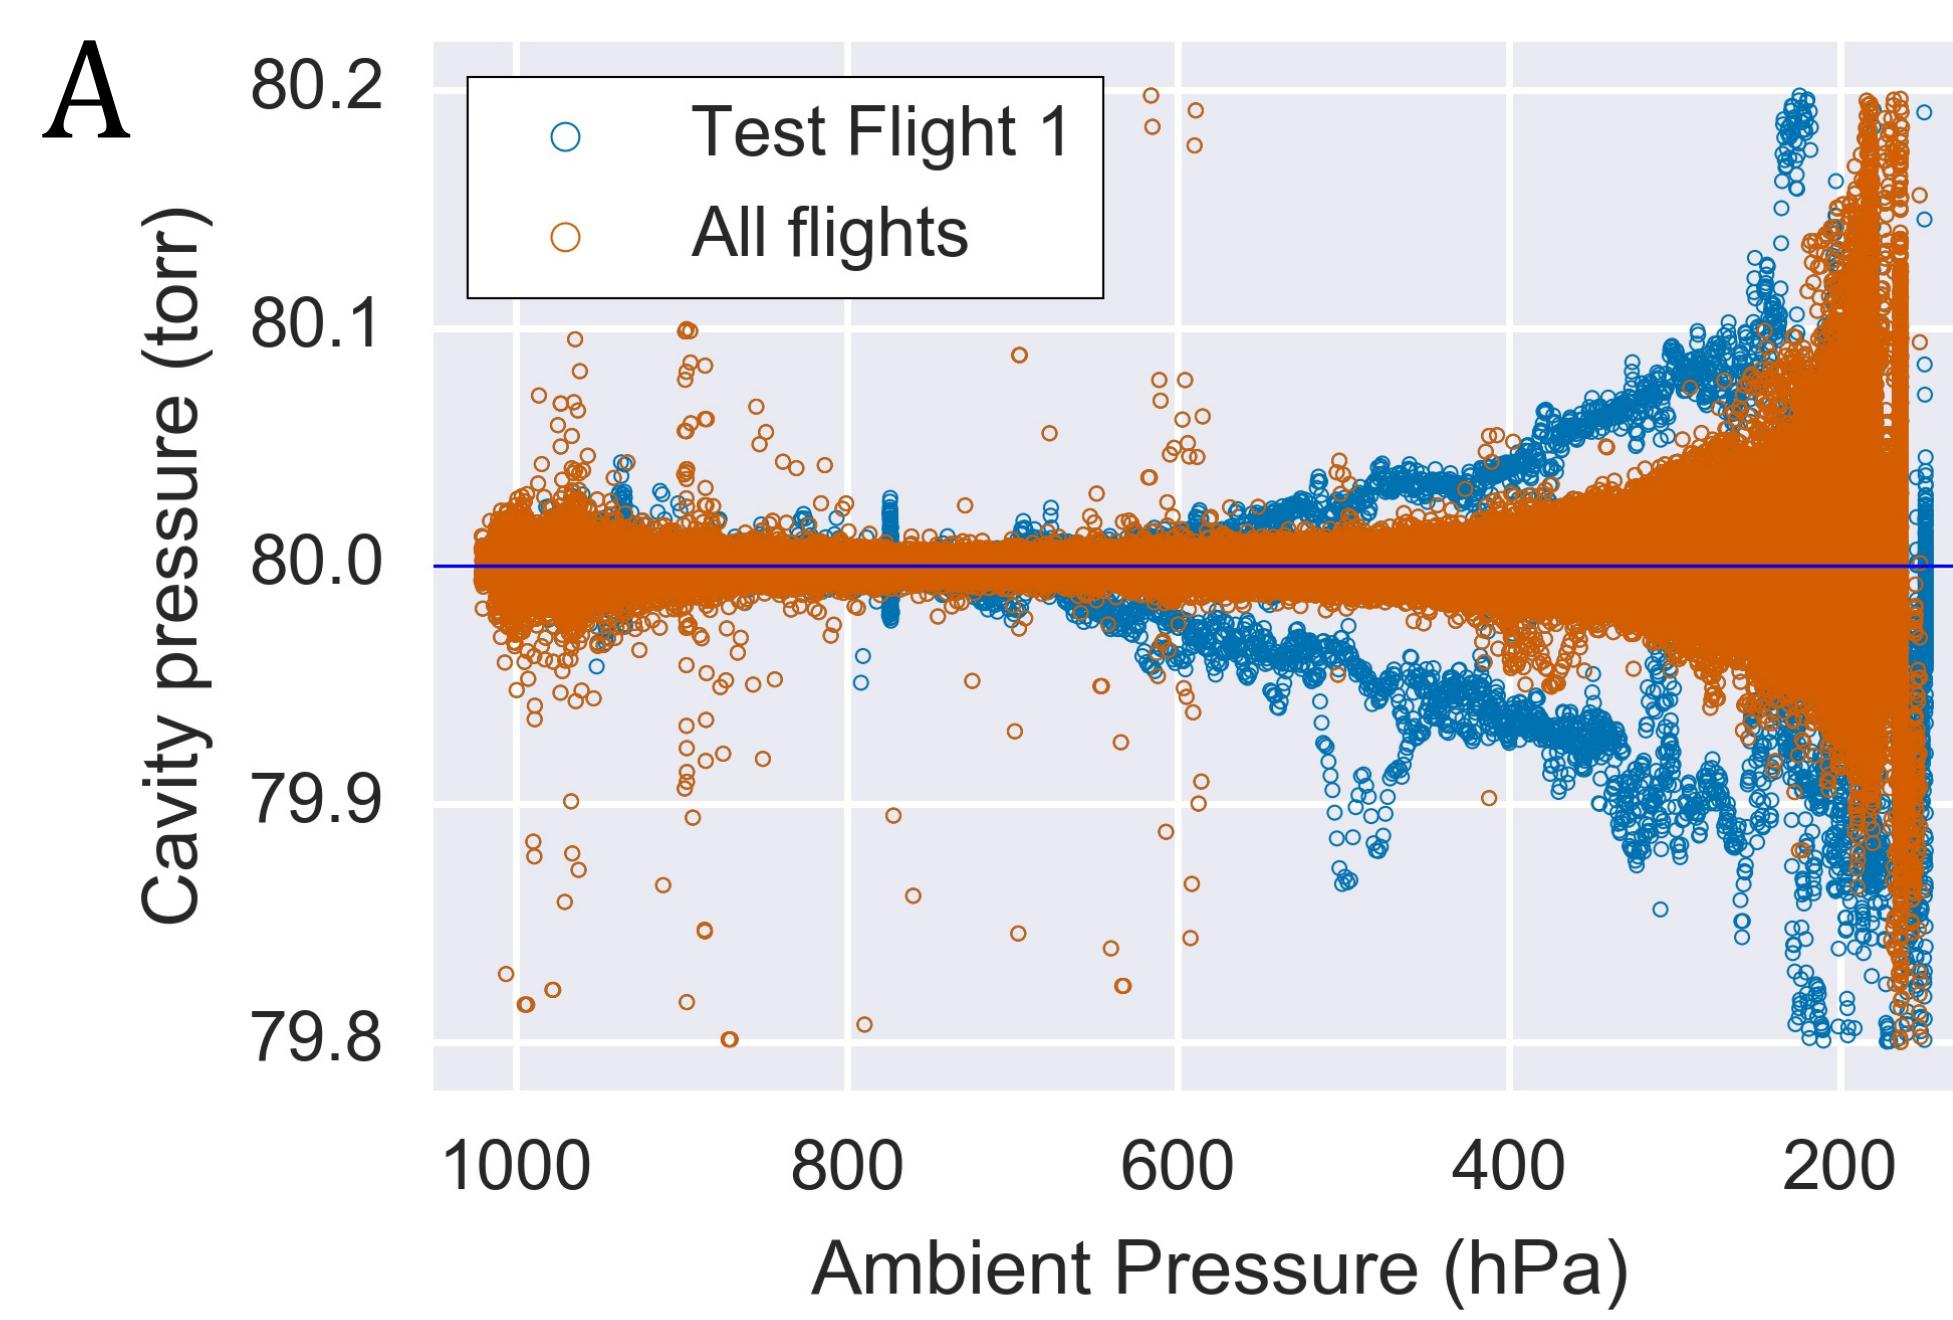

## Upcoming

ATom - NASA DC8, pole-to-pole, 2016-2018

Stratospheric Observatory for Infrared Astronomy (SOFIA, NASA)

## Cell Pressure Stability & Measurement Impact

(A) Cell pressure control parameters were optimized to the middle of the altitude range.

(B) Lab tests to derive the impact of cell pressure deviations on measured values and the concentration-dependence of correction factors

(C) A single tank was measured throughout a test flight. Corrected values were within  $\pm 0.1$  ppm CO<sub>2</sub> and  $\pm 1$  ppb CH<sub>4</sub> (95% CI).
